

Remarks/Arguments:

Claims 1-10, 12-15, 17, and 18 are pending in the present application.

Claims 1-10, 12-15, 17, and 18 stand rejected under 35 U.S.C. §§ 102(b)/103(a) as being anticipated by, or alternatively unpatentable over, Wilkinson et al. (U.S. Patent No. 5,795,669) and Katz et al. (U.S. Patent No. 4,552,857).

For the reasons outlined in the Response filed on March 12, 2004, and for the additional reasons provided below, Applicants respectfully disagree with the rejection of the claims.

As provided in the Response filed on March 12, 2004, claim 1 includes features neither disclosed nor suggested by Wilkinson and/or Katz, for example:

- (1) said first catalytic component comprises one or more electrocatalyst(s) . . . and . . . said second catalytic component comprises one or more electrocatalyst(s) . . .
- (2) said first catalytic component comprises one or more electrocatalyst(s) of formula Pt-Y, wherein Y is Mo, W or an oxide of Mo or W

Regarding the first enumerated distinction, in the Response filed on March 12, 2004, Applicants argued that while Wilkinson discloses an electrode having a second catalytic component that comprises an electrocatalyst, the first catalytic component of the electrode does **not** comprise an electrocatalyst. In response to Applicants' argument, the present Office Action provides that "Wilkinson discloses that the catalytic components may be the same or different catalyst materials." Thus, according to the Office Action, because "Wilkinson discloses a second catalytic component comprising an electrocatalyst" and because "the catalytic components may be the same or different catalyst materials," the "first catalytic component compris[es] an electrocatalyst." Applicants disagree.

Although the two catalytic components disclosed in Wilkinson may contain the same catalyst materials, the two catalytic components function differently. More specifically, the two catalytic components function differently despite possibly containing the same material because they are in different environments. To function as an electrocatalyst, a catalytic component

must be in an **ionic** environment (i.e., it must be possible to provide or remove ions from the catalytic site).

Wilkinson provides that "the second catalytic component . . . is formulated to ensure a high level of contact with the electrolyte material in order to enhance the amount of ionic contact between the electrolyte and the electrochemical catalytic component." (See Wilkinson, column 5, lines 45-49). Thus, it is clear that the second catalytic component of Wilkinson comprises an electrocatalyst.

In contrast to the second catalytic component, Wilkinson provides that "the first catalytic component active at gas phase reaction sites should not contact a significant quantity of ionically-conducting electrolyte material and preferably should not contact any, as this may reduce its effectiveness." (See Wilkinson, column 5, lines 49-53). Therefore, in order to function as a gas phase catalyst, the first catalytic component is suitably in a "non-ionic" environment because ions need not be provided to or removed from the catalytic site for it to achieve its function as a gas phase catalyst. More specifically, in Wilkinson, gas phase catalysts are provided by ensuring that the platinum or platinum alloy catalysts do not contact a significant quantity of ionically conducting material, for example, by mixing the catalysts with PTFE. (See Wilkinson, column 5, lines 45-63).

Therefore, Applicants respectfully submit that the first catalytic component of Wilkinson does not comprise an electrocatalyst as recited in claim 1 of the present application. Further, Applicants respectfully submit that, by definition, a catalytic component that is active at gas-phase reaction sites (such as the first catalytic component of Wilkinson) is not an electrocatalytic component.

Regarding the second enumerated distinction, in the Response filed on March 12, 2004, Applicants argued that Wilkinson does not disclose or suggest a first electrocatalyst comprising one or more electrocatalyst(s) of formula Pt-Y catalysts wherein Y is Mo, W or an oxide of Mo or W. To support this position, Applicants cited the *Oxford English Dictionary Online* (a copy of which is now attached) which defines base metals as "those not classed as noble or precious," and as such, the disclosure of base metals in Wilkinson is a disclosure of a very broad range of metals, and is not a disclosure or suggestion of Mo or W.

Applicants further note that Wilkinson discloses a genus (i.e., base metals) for which there is no motivation to select the species recited in claim 1 (i.e., Mo, W, or an oxide of Mo or

W). In determining if there is motivation to select a claimed species from a genus, a number of inquiries are carried out (See flow diagram at MPEP § 2144.08). These inquiries include: (a) whether the genus is so small that each member is inherently disclosed; (b) whether express teachings would have motivated the selection of the species; (c) whether there is any teaching of structural similarity between the claimed species and the disclosed genus; and (d) whether there is any other teaching to support the selection of the species. Applicants respectfully submit that the answer to each of these inquiries is negative, resulting in the conclusion that the recited species is non-obvious in view of Wilkinson. More specifically, the genus disclosed in Wilkinson (i.e., base metals) is not small, and Wilkinson discloses no (1) express teaching, (2) structural similarity, or (3) other teaching that would motivate the selection of the claimed species from the genus recited in Wilkinson.

In response to Applicants' argument in the Response filed on March 12, 2004, the present Office Action cites Katz et al. (U.S. Patent No. 4,552,857) to support the position that "in the fuel cell electrocatalyst art inexpensive base metal catalysts include Co, Ni, Mo, oxides or sulfides of nickel or cobalt, molybates or tungstates."

Applicants note that Katz does not relate to the "fuel cell electrocatalyst art." Rather, Katz relates to hydrogen evolution cathodes, which have a different function and different technical requirements than fuel cell electrocatalyst electrodes. More specifically, hydrogen evolution cathodes are used in chemical reactions consuming electricity, with a purpose of reducing electrical usage. In contrast, fuel cell electrodes are used in the production of electricity from chemical reactions, with a purpose of CO₂ poisoning. As such, the cathode structure disclosed in Katz teaches away from the electrode structure of a fuel cell. Thus, one skilled in the fuel cell electrocatalyst art would not be motivated to combine the disclosure of Katz with the disclosure of Wilkinson.

Further, the present Office Action provides no motivation in Katz to use Mo or W in the invention of Wilkinson. Mo or W are "inexpensive" insofar as they are cheaper than certain precious metals; however, there are many base metals less expensive than Mo or W.

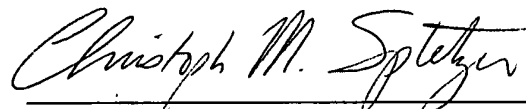

Further still, in Katz, Mo and W function as electrocatalysts. In contrast, in Wilkinson, the first catalytic component is a gas phase catalyst. Thus, there is no motivation to use a Mo or W alloy as the first catalytic component in Wilkinson.

Therefore, Applicants respectfully request reconsideration of the present rejection of claim 1.

For the reasons set forth above, Applicants respectfully submit that claim 1 is patentable over the art of record. Claim 10, while not identical to claim 1, includes features similar to those recited above with respect to claim 1. In particular, claim 10 recites "that the first catalytic component comprises one or more electrocatalyst(s) of formula Pt-Y where Y is Mo, W, or an oxide of Mo or W, and the second catalytic component comprises one or more electrocatalyst(s)." Therefore, claim 10 is also patentable over the art of record for the reasons set forth above. Each of claims 2-9, 12-15, 17, and 18, depend from one of claims 1 and 10. Thus, claims 2-9, 12-15, 17, and 18 are also patentable over the art of record for the reasons set forth above.

In view of the arguments set forth above, the above-identified application is in condition for allowance which action is respectfully requested.
